

Bursary Report on attending SM 2016 conference in Liverpool

The first thing I want say is that I appreciate very much the opportunity to attend the Symposium Mammographicum Conference 2016, thank you!

It was very interesting for me to attend all the lectures about the Breast Cancer Screening, about the recall rate, the third reader, the arbitration, how are the breast clinicians are involved in both symptomatic and screening work and also about the improvement after using Tomosynthesis and the importance of ultrasound in dense breast, especially the UST (ultrasound tomography), as an innovative research.

Very interesting also were also the lectures about Breast Cancer Screening risks:

- if you do and risks
- if you don t,
- the update on radiation risk and benefit (the effect of dose in 2D and DBT) and
- about informing women about harms as well as benefits and of course survivorship beyond breast cancer , lifestyle changes.

Very useful were for me the case reports, so interesting patients, so smart doctors! I analysed the posters and I liked very much the ones about Tomosynthesis and about male breast cancer.

Again I was impressed about the importance of MDT and MIIR expertise, very useful!

I attended also the Siemens Satellite Symposium and the Workshop Hologic 3D Mammography advance case review-very useful

Thank you again, my knowledge is better now and it was a real pleasure to be in UK again as always.
